CT-36HX40CB	AP347

This Service manual is issued as a service guide for the models of the **DX2P** family listed above. Included in this manual are a set of schematics, block diagrams, functional descriptions, alignment procedures, disassembly procedures, and a complete parts list.

WARNING! This Service Manual is designed for experienced repair technicians only and is not designed for use by the general public. It does not contain warnings or cautions to advise non-technical individuals of potential dangers in attempting to service a product. **Products powered by electricity should be serviced or repaired only by experienced professional technicians.** Any attempt to service or repair the product or products dealt with in this Service Manual by anyone else could result in serious injury or death."

The service technician is required to read and follow the "Safety Precautions" and "Important Safety Notice" in this Main Manual.

Important Safety Notice

Special components are used in this television set which are important for safety. These parts are identified on the schematic diagram by the symbol  and printed in **BOLD TYPE** on the replacement part list. It is essential that these critical parts are replaced with the manufacturer's specified replacement part to prevent X-ray radiation, shock, fire or other hazards. Do not modify the original design without the manufacturer's permission.

Safety Precautions

General Guidelines

An **Isolation Transformer** should always be used during the servicing of a receiver whose chassis is not isolated from AC power line. Use a transformer of adequate power rating as this protects the technician from accidents resulting in personal injury from electrical shocks. It will also protect the Receiver from being damaged by accidental shorting that may occur during servicing.

When servicing, observe the original lead dress, especially in the high voltage circuit. Replace all damaged parts (also parts that show signs of overheating.)

Always Replace Protective Devices, such as fishpaper, isolation resistors and capacitors, and shields after servicing the Receiver. Use only manufacturer's recommended rating for fuses, circuits breakers, etc.

High potentials are present when this Receiver is operating. Operation of the Receiver without the rear cover introduces danger for electrical shock. Servicing should not be performed by anyone who is not thoroughly familiar with the necessary precautions when servicing high-voltage equipment.

Extreme care should be practiced when **Handling the Picture Tube**. Rough handling may cause it to implode due to atmospheric pressure. (14.7 lbs per sq. in.). Do not nick or scratch the glass or subject it to any undue pressure. When handling, use safety goggles and heavy gloves for protection. **Discharge the picture tube** by shorting the anode to chassis ground (not to the cabinet or to other mounting hardware). When discharging connect cold ground (i.e. dag ground lead) to the anode with a well insulated wire or use a grounding probe.

Avoid prolonged exposure at close range to unshielded areas of the picture tube to prevent exposure to X-ray radiation.

The **Test Picture Tube** used for servicing the chassis at the bench should incorporate safety glass and magnetic shielding. The safety glass provide shielding for the tube viewing area against X-ray radiation as well as implosion. The magnetic shield limits the X-ray radiation around the bell of the picture tube in addition to the restricting magnetic effects. When using a picture tube test jig for service, ensure that the jig is capable of handling **50.0kV** without causing X-ray radiation.

Before returning a serviced receiver to the owner, the service technician must thoroughly test the unit to ensure that is completely safe to operate. **Do not use a line isolation transformer when testing.**

Leakage Current Cold Check

Unplug the AC cord and connect a jumper between the two plug prongs.

Measure the resistance between the jumpered AC plug and expose metallic parts such as screwheads, antenna terminals, control shafts, etc. If the exposed

metallic part has a return path to the chassis, the reading should be between 240k Ω and 5.2M Ω . If the exposed metallic part does not have a return path to the chassis, the reading should be infinite.

Leakage Current Hot Check (Fig. 1)

Plug the AC cord directly into the AC outlet. Do not use an isolation transformer during the check.

Connect a 1.5k Ω 10 watt resistor in parallel with a 0.15 μ F capacitor between an exposed metallic part and ground. Use earth ground, for example a water pipe.

Using a DVM with a 1000 ohms/volt sensitivity or higher, measure the AC potential across the resistor.

Repeat the procedure and measure the voltage present with all other exposed metallic parts.

Verify that any potential does not exceed 0.75 volt RMS. A leakage current tester (such a Simpson Model 229, Sencore Model PR57 or equivalent) may be used in the above procedure, in which case any current measure must not exceed 1/2 milliamp. If any measurement is out of the specified limits, there is a possibility of a shock hazard and the Receiver must be repaired and rechecked before it is returned to the customer.

X-ray Radiation

WARNING: The potential source of X-ray radiation in the TV set is in the High Voltage section and the picture tube.

Note: It is important to use an accurate, calibrated high voltage meter.

Set the **brightness, picture, sharpness** and **color** controls to Minimum.

Measure the High Voltage. The high voltage should be **31.0kV \pm 1.0kV**. If the upper limit is out of tolerance, immediate service and correction is required to insure safe operation and to prevent the possibility of premature component failure.

Horizontal Oscillator Disable Circuit Test

This test must be performed as a final check before the Receiver is returned to the customer. See **Horizontal Oscillator Disable Circuit Procedure Check** in this manual.

Service Notes

Note: These components are affixed with glue. Be careful not to break or damage any foil under the component or at the pins of the ICs when removing. Usually applying heat to the component for a short time while twisting with tweezers will break the component loose.

Leadless Chip Component (surface mount)

Chip components must be replaced with identical chips due to critical foil track spacing. There are no holes in the board to mount standard transistors or diodes. Some chips capacitor or resistor board solder pads may have holes through the board, however the hole diameter limits standard resistor replacement to 1/8 watt. Standard capacitor may also be limited for the same reason. It is recommended that identical components be used.

Chip resistor have a three digit numerical resistance code - 1st and 2nd significant digits and a multiplier. Example: 162 = 1600 or 1.6kΩ resistor, 0 = 0Ω (jumper). Chip capacitors generally do not have the value indicated on the capacitor. The color of the component indicates the general range of the capacitance.

Chip transistors are identified by a two letter code. The first letter indicates the type and the second letter, the grade of transistor.

Chip diodes have a two letter identification code as per the code chart and are a dual diode pack with either common anode or common cathode. Check the parts list for correct diode number.

Component Removal

1. Use solder wick to remove solder from component end caps or terminal.
2. Without pulling up, carefully twist the component with tweezers to break the adhesive.
3. Do not reuse removed leadless or chip components since they are subject to stress fracture during removal.

Chip Component Installation

1. Put a small amount of solder on the board soldering pads.
2. Hold the chip component against the soldering pads with tweezers or with a miniature alligator clip and apply heat to the pad area with a 30 watt iron until solder flows. Do not apply heat for more than 3 seconds.

How to Replace Flat-IC

- Required Tools -

- Soldering iron
- De-solder braids
- Iron wire or small awl
- Magnifier

1. Remove the solder from all of the pins of a Flat-IC by using a de-solder braid.

2. Put the iron wire under the pins of the Flat-IC and pull it in the direction indicated while heating the pins using a soldering iron. A small awl can be used instead of the iron wire.

3. Remove the solder from all the pads of the Flat-IC by using a de-solder braid.

4. Position the new Flat-IC in place (apply the pins of the Flat-IC to the soldering pads where the pins need to be soldered). Properly determine the positions of the soldering pads and pins by correctly aligning the polarity symbol.

5. Solder all pins to the soldering pads using a fine tipped soldering iron.

6. Check with a magnifier for solder bridge between the pins or for dry joint between pins and soldering pads. To remove a solder bridge, use a de-solder braid as shown in the figure below.

Service Notes (Continued)

IMPORTANT: To protect against possible damage to the solid state devices due to arcing or static discharge, make certain that all ground wires and CTR DAG wire are securely connected.

CAUTION: The power supply circuit is above earth ground and the chassis cannot be polarized. Use an isolation transformer when servicing the Receiver to avoid damage to the test equipment or to the chassis. Connect the test equipment to the proper ground (Hot \oplus) or (Cold \ominus) when servicing, or incorrect voltages will be measured.

WARNING: This Receiver has been designed to meet or exceed applicable safety and X-ray radiation

protection as specified by government agencies and independent testing laboratories.

To maintain original product safety design standards relative to X-ray radiation and shock and fire hazard, parts indicated with the symbol \triangle on the schematic must be replaced with identical parts. Order parts from the manufacturer's parts center using the parts numbers shown in this service manual, or provide the chassis number and the part reference number.

For optimum performance and reliability, all other parts should be replaced with components of identical specification.

Figure 2. Power Supply Jig Detail (D-Board)

Horizontal Oscillator Disable Circuit

This chassis employs a special circuit to protect against excessive high voltage and beam current. If, for any reason, the high voltage and beam current exceed a predetermined level this protective circuit activates and detunes the horizontal oscillator that limits the high voltage. The over-voltage protection circuit is not adjustable. However, if components indicated by the symbol \triangle on the schematic in either the horizontal sweep system or the over-voltage protection circuit itself are changed, the operation of the circuit should be checked using the following procedure:

Equipment needed to check the disabled circuit:

1. High Voltage Meter (0- 50kV)
2. Variac or Isolation Transformer
3. 1k ohm VR
4. DC Ammeter

Preparation

1. Connect Receiver to AC 120 Volts. Do not turn ON.
2. Connect HIGH VOLTAGE meter to 2nd anode (H.V. button). **Note:** Use cold ground(\ominus) for negative lead.
3. Connect the ammeter serial from the flyback anode lead to the picture tube anode socket.
4. Prepare HHS jig to be connected between TPD50 and TPD51 as shown above.

Procedure:

1. Open Connector A17.
2. Turn power ON and Apply a monoscope pattern.
3. Set current within 50-100 μ A by changing the picture and bright controls.
4. Turn power OFF.
5. Connect HHS jig between **TPD50** and **TPD51** as shown above (VR should be turn fully clockwise).
6. Turn power on.
7. Using the variable resistor slowly increase the current until the horizontal sync frequency abruptly increases indicating that the horizontal frequency is just beginning to pull out of sync. Maintain the current within 50-100 μ A by changing the picture and bright controls
8. Observe the High Voltage meter. **HIGH VOLTAGE** should read less than **40.2kV**.
9. Turn power OFF, Remove HHS jig, HV meter, ammeter and connect A17 connector.
10. Turn Power ON. Reset Picture and Brightness controls. Confirm **B+ 144V \pm 1.5V** with 120V AC applied.

Note: **IF HIGH VOLTAGE IS NOT WITHIN THE SPECIFIED LIMIT THE CAUSE MUST BE DETERMINED BEFORE THE RECEIVER IS RETURNED TO THE OWNER.**

Location of Controls (Receiver)

Figure 3. Location of Controls Receiver
Quick Reference Control Operation

Quick Reference Control Operation

- 1 **Power Button** - Press to turn ON or OFF.
- 2 **Volume Buttons** - Press to adjust Sound Level, or to adjust Audio Menus, Video Menus, and select operating features when menus are displayed
- 3 **Channel Buttons** - Press to select programmed channels. Press to highlight desired features when menus are displayed. Also use to select Cable Converter box channels after programming Remote Control Infrared codes (the TV/AUX/CABLE switch must be set in CABLE position).
- 4 **Action Button** - Press to display Main Menu and access On Screen feature and Adjustment Menus.
- 5 **TV/Video Button** - Press to select TV or one of two Video Inputs, for the Main Picture or the PIP frame (when PIP frame is displayed).

Location of Controls (Remote)

POWER Button
Press to turn ON and OFF.
MUTE Button
Press to mute sound. A second press resumes sound. Press also to access and delete Closed Caption display.
VCR, DVD, LD/CD, AUX, TV, CBL, DBS, RCVR
Component function buttons
VOL (volume) Buttons
Press to adjust TV sound level. Use with Channel buttons to navigate in menus.
R-TUNE (Rapid Tune) Button.
Press to switch to the previous channel.
ACTION Button
Press to display Main Menu and access or exit On Screen features and Adjustment Menus.
REW, PLAY, FF, TV/VCR, STOP, PAUSE, REC, VCR CHANNEL
Component function buttons.

LIGHT
Press to light Remote control buttons
MULTI Button
Programmable button that can operate up to seven (7) functions at once
TV/VIDEO Button
Press to select TV or Video input.
CH (channel) Buttons
Press to select channels. Use with volume buttons to navigate in menus.
DBS EXIT, DBS GUIDE
DBS function buttons.
RECALL Button
Press to display Time, status of Sleep Timer, Channel, Video mode and Channel Caption (Station Identifier).
OPEN/CLOSE, SLOW, STILL
DVD function buttons.
"0" - "9"
Press numeric keypad to select any channel.

EUR511158

Figure 4. Location of Controls (Remote)

For more functions and information about this Remote Control, refer to the Remote Guide listed in Parts List of this manual

Disassembly for Service

Back Cover

Remove all the screws marked with an arrow(←) from the back of the Receiver. (See Fig. 8)

Note: Screw configuration, type, and number of screws vary depending on the model of the Receiver serviced and the application; various models are covered in this Manual. Use same hardware when reassembling the receiver.

- 4 screws at the top edge of the Receiver.
- 4 screw by the A/V jacks.
- 1 screw by the antenna jacks.
- 1 screw by the Dolby Center Ch Input.
- 1 screw at the lower part of TV.
- 1 screw at each lower corner of the Receiver.
- 1 screw by the retainer plate of the AC power cord.
- 1 screw by the AC Cord assembly.

Note: Extensions for board connectors may be needed to take voltages on H-Board, AG-Board, Q-Board and P-Board, please see Parts List section for part numbers in this Service Manual.

A-Board - Main Chassis (See Fig. 49)

The H, AG and DG-Board are assembled on the Main chassis (A-Board). When servicing these boards, extension cables may be required. Cables kit can be ordered from Matsushita Services Company, Part No. TXAZS011SER. The A-Board assembly rest on a chassis tray along with the D-Board.

Slide chassis tray out. Gently lift, tray and pull out. Disconnect plug connectors; release wire ties and holders as required for complete chassis removal.

- A. A-Board is secured to the chassis tray with five screws.
- B. The D-Board is secured to the chassis tray with five screws
- C. The A-Board is mated to the D-Board by four flexible connectors: A4, A5, A6 & A7 (D4, D5, D6 & D7 on the D-Board, respectively). To remove either boards, unplug the connectors on the A-Board.

Note: Some tie-wraps that secure the wire dressings may need to be unfastened for chassis removal.

L-Board - CRT Output

Plugs into the socket on the CRT neck.

To remove this board, first unplug the board from the CRT neck, then disconnect L1, L2 & L3 connectors, to disconnect the focus F1(Red Cable) & F2(White Cable) cables, pull the tab and release the cables, finally disconnect the screen cable from the D-Board D16.(See Fig. 6).

To reinsert back the cables, remember the original position of cables, F1(red cable) goes to A on the CRT socket and F2(white cable) goes to B on the CRT socket.

Figure 5. F1 & F2 cables release

To release screen GND cables from L-Board L11 & L12 connectors, insert a wire in both sides of connector and pull upwards the cable, then remove the wire (See Fig. 6)

Figure 6. L-Board Screen GND cables release

H-Board - A/V Jacks, S-Video Connectors, and S-Video Switch

Plugs onto A-Board at the A9 connector.

Note: Use a small flat head screwdriver to release the connector locking tabs.

AG-Board

Plugs onto A-Board at the A25 & A26 connectors.

Note: Use a small flat head screwdriver to release the connector locking tabs.

DG-Board

Plugs onto the A-Board at the A10 connector.

Note: This Board is Not-Serviceable.

When removing this board pull carefully.

Q-Board

Plugs onto the D-Board at the D8, D9 & D10 connectors.

P-Board

Plugs onto the right side of the D-Board at D1, D2 & D3 connectors; First remove the three screws that holds the metal board, one from the flyback

and two from the chassis tray and then use a flat head screwdriver to release the connector locking tabs and pull upwards the board.

G-Board

Mated to A-Board by three flexible connectors. To remove this board, first unplug the three flexible connectors, then pull upwards the board while unlock the tabs from the chassis tray.

Speakers

Each speaker is secured to a plastic base with 4 screws, and each plastic base is secured to a second base with two screws, and secured to the cabinet with two screws.

Note: Be sure to reconnect the speaker wires to the correct speaker lead (+) (-)

Disassembly for CRT Replacement

1. Discharge the CRT as instructed in the **Safety Precautions** (see page 2) and remove 2nd anode button from the CRT.
2. Remove Speaker Modules (R & L)
3. Perform complete removal of Chassis, as instructed in **Disassembly for Service**.

Note: When remounting the CRT, reuse the metal sheet located in the lower part of the cabinet holding the CRT, hold with screws to the cabinet. This metal sheet is not supplied with the CRT replacement.

CRT Replacement

1. Perform **Disassembly for CRT Replacement** procedure.
2. Insure that the CRT H.V. Anode button is discharged before handling the CRT. Read the **Safety Precautions** (see page 2) on handling the picture tube.
3. Remove the components from the CRT neck and place the cabinet face down on a soft pad.
4. Note the original order for the CRT mounting hardware as they are remove from the CRT mounting brackets at each corner of the CRT.
5. Remove the CRT with the degaussing coil and the dag ground braid attached.

Note: To remove the four brackets holding the degauss coil from the corners of the CRT, first remove the CRT from the cabinet, then remove the Brackets by pressing the tab on the bracket and pull upwards. These Brackets are included in the Degauss Coil Kit, for part number, please see parts list section (See Fig. 7).

Figure 7. Brackets removal

6. Note the original locations and mounting of the degaussing coil and the dag ground assembly to insure proper reinstallation on the replacement CRT.
To remove and remount the degaussing coil: The degaussing coil is held in place by clampers fastened to the CRT corner ears. These clampers must be installed onto the replacement CRT prior to mounting the degaussing coil.
To remove and remount the dag ground braid:
 - a. Unhook the coil spring from the bottom corners of the CRT ears.
 - b. Release the braid loop from the upper corners of the CRT ears.
7. Mount the dag ground braid on the replacement CRT. Position the degaussing coil with new ties. Dress coil as was on the original CRT.
8. Replace the components on CRT neck and reinstall into cabinet. Verify that all ground wires and circuit board plugs get connected.

Note: Reuse all the clampers and mounting brackets from the degauss coil and screen, and when remounting the degauss coil assure that is not touching the speakers, this can be done by placing some tape (See Fig. 7), this may cause mask vibration. The mounting brackets and clampers are not supplied with the replacements.

Important Notice:

When ordering the CRT, please order CRT and CRT KIT also. Please see parts list section for part numbers

Back Cover Removal

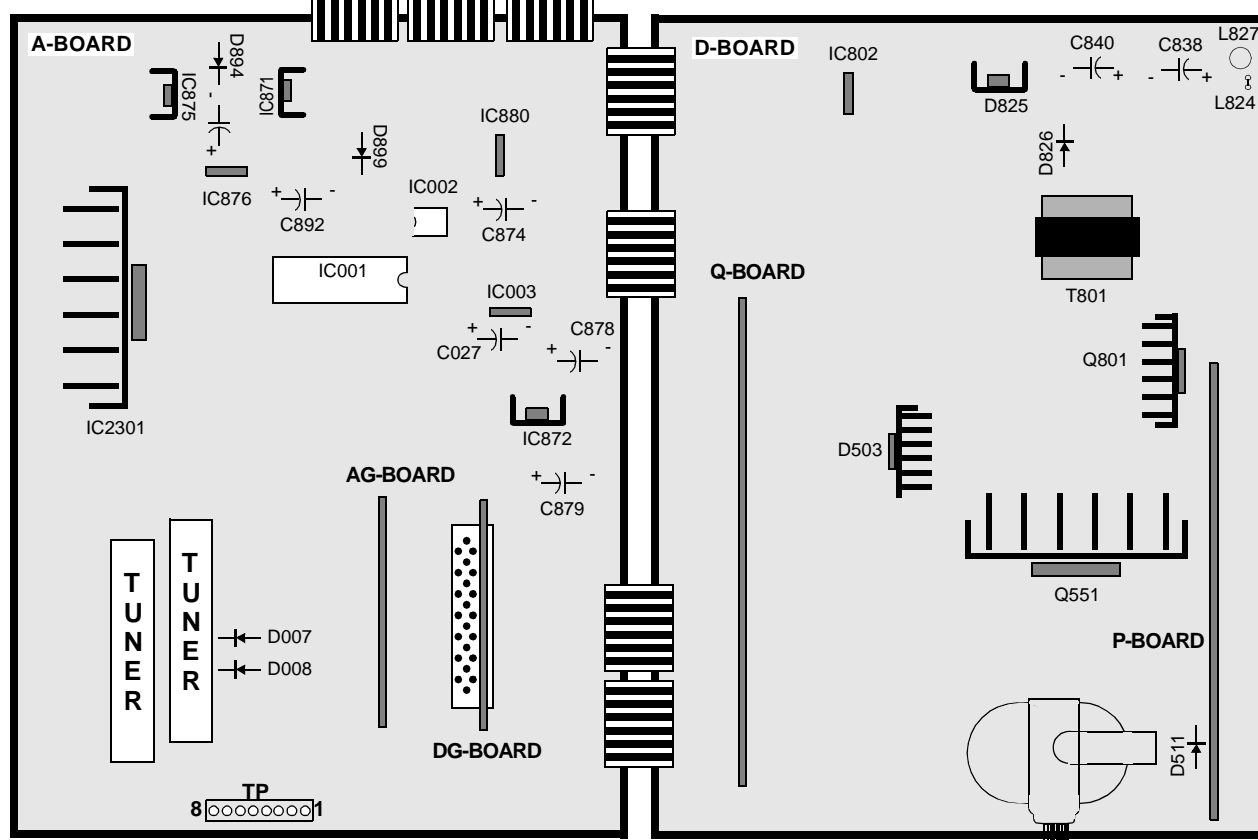

Figure 8. Back Cover Removal.

Chassis Service Adjustment Procedures

All service adjustments are factory preset and should not require adjustment unless controls and/or associated components are replaced.

Note: Connect the (-) lead of the voltmeter to the appropriate ground. Use Q801's heat sink when the HOT ground symbol (↕) is used. Otherwise, use COLD ground (↗) — Tuner shield, IC2301's heat sink (See Fig. 50)

MOMENTARILY CONNECT A JUMPER FOR ENTERING SERVICE MODE (FA1 to FA2)

140.0V B2+ Voltage Check

1. Set the **Bright** and **Picture** to Minimum by using the Picture Menu.
2. Connect the DVM on **TPP17** (D-Board) and cold ground (↗).
3. Confirm that B2+ voltage is **144.0V ± 1.5V**. This voltage supplies B2+ to the Horizontal Output & Flyback circuits.

Source Voltage Chart

120V AC line input. Set the **Bright** and the **Picture** to Minimum by using the Picture Menu. Use cold (↗) or Hot (↕) ground for the (-) lead of the DVM as needed.

LOCATION	VOLTAGE
MAIN 12V (IC876 PIN-2) A-Board TPA6	12.0 ± 0.5V
MAIN 9V (CATHODE D894) A-Board TPA7	9.0V ± 0.5V
MAIN 5V (IC872 PIN-1) A-Board TPA8	5.0V ± 0.3V
MAIN 3.3V (IC872 PIN-2) A-Board TPA14	3.5V ± 0.2
GC 3.3V (IC880 PIN-2) A-Board TPA15	3.5V ± 0.2V
STBY 3.3V (IC003 PIN-4) A-Board TPA16	3.3 ± 0.2V

LOCATION	VOLTAGE
STBY 5.0V (IC002 PIN-8) A-Board TPA17	5.0 ± 0.2V
BTL 30V (CATHODE D007) A-Board TPA18	32.0V ± 2.0V
+B2 (BY IC802 & Q854) D-Board TPP17	144.0V ± 1.5V
40V (CATHODE D826) D-Board TPP25	40.0V ± 3.0V
25V (BY D825) D-Board TPP19	26.8V ± 2.0V
15V (BY C840 & L826) D-Board TPP20	15.0V ± 1.5V
-15V (BY C838 & C838) D-Board TPP21	-15.1V ± 1.5V
SOUND (BY L827 & L824) D-Board TPP22	32.5V ± 2.0V
220V (CATHODE D511) D-Board TPD7	220.0V ± 9.0V

High Voltage Check

1. Select an active TV channel and confirm that horizontal is in sync.
2. Adjust Brightness and Picture using Picture Icon menu so video just disappears.
3. Confirm B2+ 144 ± 1.5V is within limit.
4. Using a high voltage meter confirm that the High Voltage is **31.0kV ± 1.0kV**.

Purity and Convergence Procedure

Adjustment is necessary only if the CRT or the deflection yoke is replaced or if the setting was disturbed. The complete procedure consists of:

1. Vertical Raster Shift Adjustment.
2. Initial static convergence.
3. Setting the purity.
4. Final static convergence.

When the CRT or the Yoke is Replaced

Place the yoke on the CRT neck (do not tighten the clamp).

Place the vertical raster shift tabs at 3 o'clock (90° from the purity and convergence tabs (See Fig. 9 and Fig. 10)

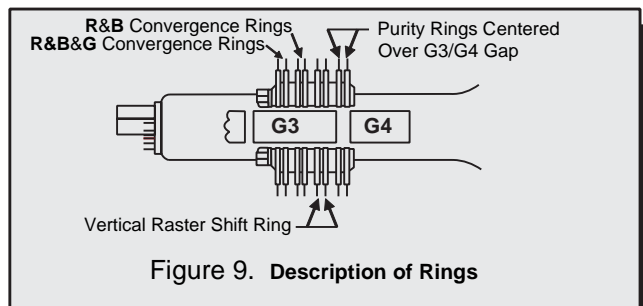

Figure 9. Description of Rings

Figure 10. Initial positioning of Rings

Turn the Receiver ON. Operate the Receiver for 60 minutes using the first Purity Check field (white screen) to stabilize the CRT.

Fully degauss the Receiver by using an external degaussing coil.

Slide the deflection yoke back and forth on the neck of the CRT until it produces a near white, uniform raster.

Vertical Raster Shift Adjustment

Apply a green pattern with a horizontal line, adjust the Deflection Yoke so that has no tilt, then secure it.

Adjust center line of the pattern with the mechanical center of the CRT, this center is determined by two marks at the side edges of the screen. To adjust the line, once the vertical raster shift tabs are place at 3 o'clock to reduce its magnetic field effect (see Fig. 9) open the tabs the same angle from the center, until the center line of the pattern becomes a straight line, centered with the marks of the CRT. (see Fig. 10)

Important Notice:

Rings come along with Deflection Yoke in one piece.

Figure 11. Vertical Raster Shift Adjustment

Initial Center Static Convergence

Connect a dot/cross hatch generator to the Receiver and tune in a signal. Observe misconvergence at center of the screen only.

Adjust the R&B pole magnets; by separating tabs and rotating to converge blue with red.

Adjust the R&B and R&B&G pole magnets: by separating tabs and rotating to converge blue and red (magenta) with green.

Note: Precise convergence at this point is not important.

Purity Adjustment

When the Receiver is in the Serviceman Mode for making electronic adjustments, press the **Recall** button on the Remote Control to enter Purity Check. (See the **Service Adjustments Electronic Controls** procedure).

Operate the Receiver for 60 minutes using the first Purity Check field (white screen) to stabilize the CRT.

Fully degauss the Receiver by using an external degaussing coil.

Press the **Recall** button on the Remote Control again until the Purity Check (green screen) appears.

Loosen the deflection yoke clamp screw and move the deflection yoke back as close to the purity magnet as possible.

Adjust the Purity rings to set the vertical green raster precisely at the center of the screen (see Fig. 12).

Slowly move the deflection yoke forward until the best overall green screen is displayed.

Tighten the deflection yoke clamp screw.

Press the **Recall** button on the Remote Control again until the purity check blue and red screens appear and observe that good purity is obtained on each respective field.

Press the **Recall** button on the Remote Control again until Purity check (white screen) appears. Observe the screen for uniform white. If purity has not been achieved, repeat the above procedure.

Final Convergence Procedure

Note: Vertical size and focus adjustments must be completed prior to performing the convergence adjustment. Connect a dot pattern generator to the Receiver. The **Brightness** level should not be higher than necessary to obtain a clear pattern.

Converge the red and the blue dots at the center of the screen by rotating the R&B pole Static Convergence Magnets.

Align the converged red/blue dots with the green dots at the center of the screen by rotating the R&B&G pole Static Convergence Magnets. Melt wax with soldering iron to reseal the magnets.

Slightly tilt vertically and horizontally (do not rotate) the deflection yoke to obtain a good overall convergence.

If convergence is not reached at the edges, insert permalloy in the DY corners to achieve proper convergence (See "Permalloy Convergence Corrector Strip (Part No. 0FMK014ZZ)" on page 17.) Recheck for purity and readjust if necessary.

After vertical adjustment of the yoke, insert wedge at 11 o'clock position, then make the horizontal tilt adjustment.

Secure the deflection yoke by inserting four side wedges.

Apply adhesive between tab (thin portion) of wedge and CRT and place tape over the tab to secure to the CRT.

Dynamic Convergence Adjustment

Use this for a precisely overall convergence adjust at the edges.

DY(Y_{HC} , Y_v , X_v) Adjustment

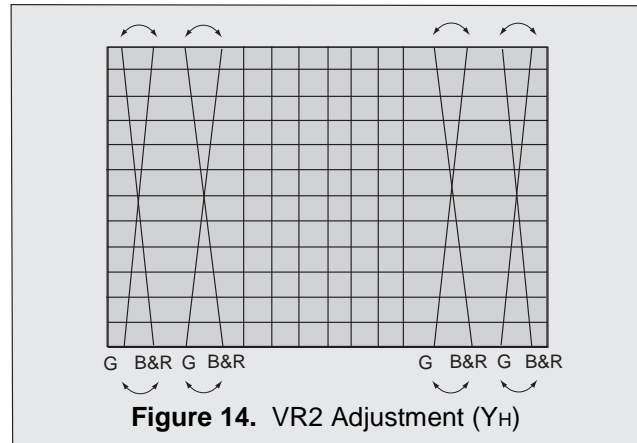

Y_v Adjustment (VR1 for Horizontal dynamic convergence)

1. Apply a crosshatch pattern.
2. Adjust contrast and brightness customer controls to obtain a correct picture.
3. With a driver adjust VR1 (located in deflection yoke board Fig. 19) to obtain a proper convergence at top and bottom of the screen (See Fig. 13)

Y_H Adjustment (VR2 for Vertical dynamic convergence)

1. Apply a crosshatch pattern.
2. Adjust contrast and brightness customer controls to obtain a correct picture.
3. With a driver Adjust VR2 (located in deflection yoke board Fig. 19) to obtain a proper convergence at left and right side of the screen. (See Fig. 14)

X_v Adjustment (precise adjustment)

1. Apply a crosshatch pattern.
2. Adjust contrast and brightness customer controls to obtain a correct picture.
3. With a driver adjust the coil located in deflection yoke board to obtain a proper convergence horizontally.

Note: Apply a red pattern and confirm purity, if purity is poor, repeat purity adjustments.

Permalloy Convergence Corrector Strip (Part No. 0FMK014ZZ)

This strip is used in some sets to match the yoke and CRT for optimum convergence. If the yoke or CRT is replaced, the strip may not be required.

First converge the set without the strip and observe the corners.

If correction is needed:

1. Place strip between CRT and yoke, in quadrant needing correction. Slowly move it around for desired results.
2. Press adhesive tightly to the CRT and secure with tape.

DAF Adjustment

Preparation:

1. Apply a crosshatch pattern.
2. Set user controls, bright to center and picture to max.

Procedure:

1. Connect channel one of the oscilloscope with 100x1 probe to D1505A (DAF waveform).
2. Connect channel two of the oscilloscope with 10x1 probe to D504K or R519 (FBP waveform).
3. If the peak position of the waveforms are different, in Serviceman Mode, adjust "HDAFC" DATA so that become the same position. (See Fig. 16)

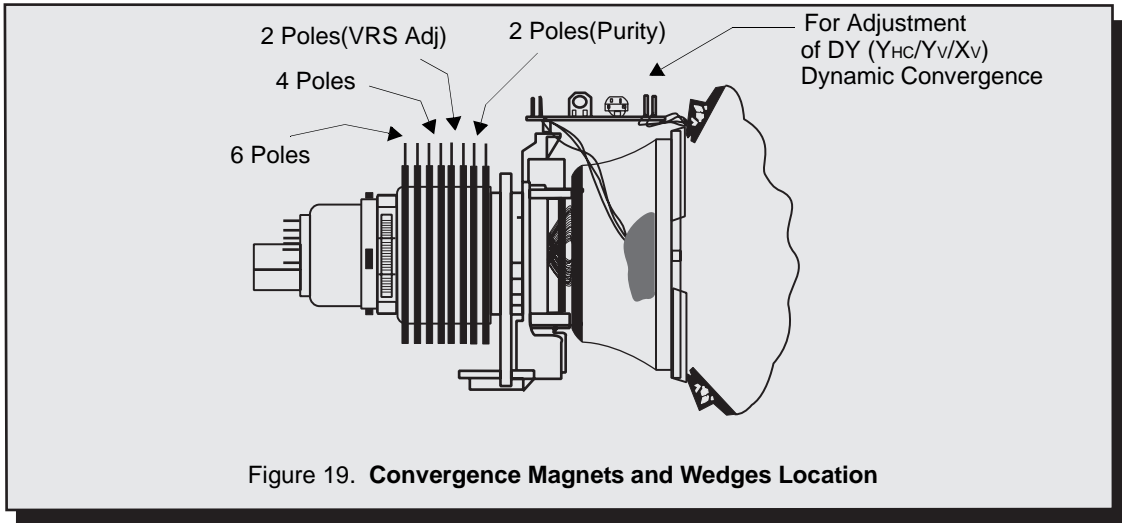

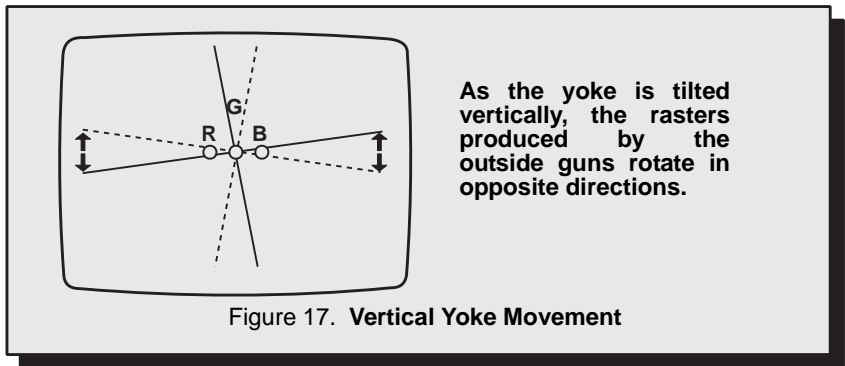

Figure 16. DAF Adjustment

IMPORTANT NOTE:
Always Exit the Serviceman Mode Following Adjustments.

Serviceman Mode (Electronic Controls)

This Receiver has electronic technology using the I²C Bus Concept. It performs as a control function and it replaces many mechanical controls. Instead of adjusting mechanical controls individually, many of the control functions are now performed by using "On Screen Display Menu". (The **Serviceman Adjustment Mode**.)

Note: It is suggested that the technician reads all the way through and understand the following procedure for Entering/Exiting the **Serviceman Adjustment Mode**; then proceed with the instructions working with the Receiver. When becoming familiar with the procedure, the Flow Chart for Serviceman Mode may be used as a quick guide.

Quick Entry to Serviceman Mode:

When minor adjustments need to be done to the electronic controls, the method of Entering the serviceman Mode without removal of the cabinet back is as follows using the Remote Control:

1. Select SET-UP icon and select CABLE mode.
2. Select TIMER icon and set SLEEP time for 30 Min.
3. Press "ACTION" twice to exit menus.
4. Tune to the Channel 124.
5. Adjust VOLUME to minimum (0).
6. Press VOL ◀ (decrease) on Receiver. Red "CHK" appears in upper corner.

Note: After Receiver is set into SERVICEMAN mode, set TIMER back to NO.

To toggle between Aging and Serviceman modes:

While the "CHK" is displayed on the left top corner of the CRT, pressing "ACTION" and "VOL" UP on the TV simultaneously will toggle between the modes. Red "CHK" for Serviceman and yellow

7. Press Power on the Remote Control to display the Serviceman Adjustment Modes menu, select adjustment by pressing the volume right/left buttons and channel up/down buttons on the remote and ACTION to enter the adjustment.

MODE	480I	480P	1080I	
MTS	4:3	16:9	DW	
CLOCK	MTSIN	SEPAL	SEPAH

	TRAP	PARA	SIDE	
VDEF	V RAS	VEAMP	V-C	V-S
DAF	HDAFC	VDAFG		

Figure 20. Serviceman Mode Menu Adjustments.

Note: Some adjustments are available only in some modes (480i, 480p, 1080i); it is needed to apply the format.

Exiting the Serviceman Mode:

Press Action and Power on the Receiver simultaneously for at least 2 seconds.

THE RECEIVER EXITS SERVICEMAN MODE.

The Receiver momentarily shuts off; then comes back on tuned to channel 3 with a preset level of sound. Any programmed channels, channels caption data and some others user defined settings will be erased.

IMPORTANT NOTE:
Always Exit the Serviceman Mode Following Adjustments.

To Check Purity:

Press Recall on the Remote Control when in Serviceman Mode (red "CHK" is displayed) to enter the Purity Field Check Mode.

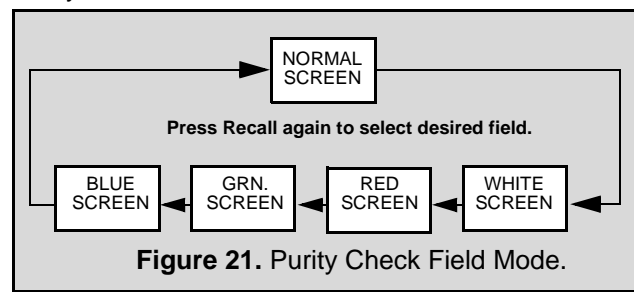

Figure 21. Purity Check Field Mode.

Helpful Hints

Entering Serviceman Mode (Open-Back Method)

- While the Receiver is connected and operating in Normal Mode, momentarily short test point FA1 to Cold Ground (↗) (A-Board).

The Receiver enters the Aging Mode.

Yellow letters "CHK" appear in the upper left corner of the screen.
(The Volume, Up/Down will adjust rapidly).

For Adjustments:

1. Press **Channel Up/Down** and **Volume Right/Left** on the **Remote Control** to select one of the available Service Adjustments (Fig. 20). Press **ACTION** to enter the adjustment. Press **ACTION** again to go back to the adjustments menu (Fig. 20).

Note: Write Down the original value set for each address before modifying anything. It is easy to erroneously adjust the wrong item.

2. Press **Volume Right/Left** on the **Remote Control** to adjust the level of the selected Service Adjustment (Fig. 20).

Instructional Flow Chart for Serviceman Mode - Continued

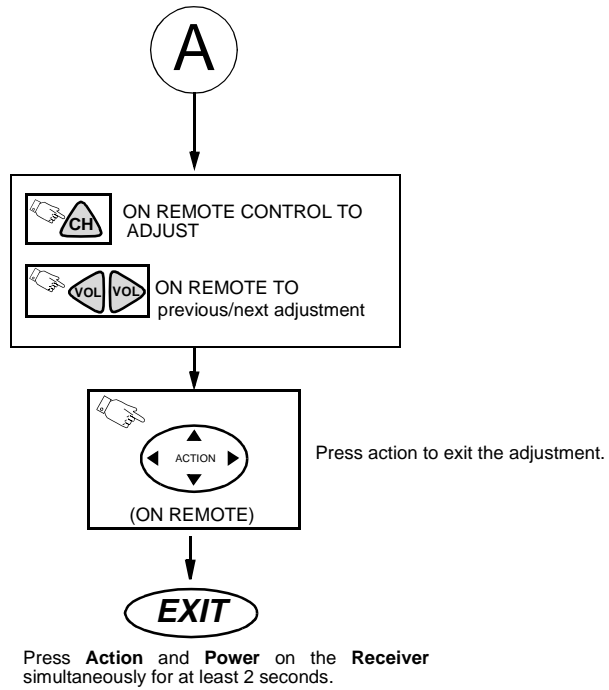

Figure 23. Flow Chart for Serviceman Mode (Continued).

Service Adjustments (Electronic Controls)

Sub-Brightness

Serviceman DAC Adjustment (BRIGHT)

Adjustment of this control is important for setting proper operation of customer brightness and picture controls. **Do not adjust** the SCREEN VR after the Sub-Brightness is set.

Preparation:

1. Normalize picture settings.
2. Switch NATURAL COLOR to OFF.
3. Switch COLOR TEMPERATURE to NORMAL.

Procedure:

1. Apply a black white cross pattern.
2. In the Serviceman Mode for making electronic adjustments, select the DAC adjustment (BRIGHT) and adjust data so that 7.5IRE part is the same light output as the 3IRE part.

Sub-Contrast

Serviceman DAC Adjustment (BRIGHT, CONT)

This adjustment is factory set. **Do not adjust** unless repairs are made to associated circuit, the CRT Board or when the CRT is replaced.

Preparation:

1. Apply a Black-White pattern.
2. Set the picture settings to normal.
3. Connect the oscilloscope to TP47G.
4. Connect a jumper from A15-PIN(6) to cold ground (↗).

Procedure:

1. In the Serviceman Mode, select DAC for Green Cutoff Adjustment (CUT G) and set data to 2 80.
2. Set user color to minimum.
3. In Serviceman Mode, select DAC for Brightness adjustment (BRIGHT), and adjust data to obtain 2.6v between 7.5IRE and GND level at TP47G. (See waveform detail, Fig. 25)
4. In Serviceman Mode, select DAC for Contrast adjustment (CONT), and adjust data to obtain $3.3 \pm 0.1V$ between 7.5IRE and 100IRE level at TP47G. (See waveform detail, Fig. 25)
5. Set user color to normal.
6. Remove the jumper.

Color Output Adjustment

Serviceman DAC Adjustment (COLOR, TINT)

Make sure that Sub-Contrast adjustment was finished prior to do this adjustment

Preparation:

1. Normalize the picture settings.
2. Switch NATURAL COLOR to OFF.
3. Connect a jumper from A15 PIN(6) to cold ground (↗).

Procedure:

1. Apply a rainbow color bar pattern.
2. In Serviceman Mode adjust "R DR" and "B DR" data to "AF".
3. Connect the oscilloscope to TP47B.
4. In Serviceman Mode adjust "TINT" data so that the peak white is located at same level as peak "3", within $0 \pm 0.03V$. (See waveform detail, Fig. 26),

5. Connect the oscilloscope to TP47R.
6. In Serviceman Mode adjust "COLOR" data so that the amplitude "a" is $1.0 \pm 0.03V$. (See Fig. 27)

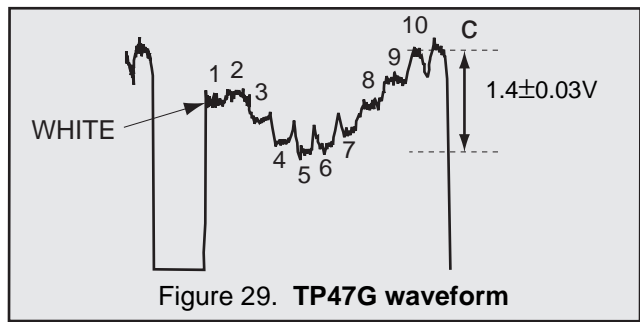

Service Adjustments (Electronic Controls, cont.)

7. Connect the oscilloscope to TP47B.
8. In Serviceman Mode adjust "B-Y G" data so that the amplitude "b" is $1.35 \pm 0.03V$. (See Fig. 28)

9. With oscilloscope still connected to TP47B, adjust "TINT" data so that the peak WHITE is located at same level as peak "3", within $0 \pm 0.03V$, then increase "TINT" data by 3 steps.
10. Connect oscilloscope to TP47G.
11. In Serviceman Mode adjust "COLOR" data so that the amplitude "c" is $1.4 \pm 0.03V$. (See Fig. 29).

12. Apply a studio color bar pattern and confirm that saturation and phase are normal (normal image).

Color Temperature Adjustment (B/W Tracking)

Serviceman DAC Adjust. (CUT R) (CUT G) (CUT B) (R DR) (B DR)

Minor Touch-Up Method

OBSERVE low and high brightness areas of a B/W picture for proper tracking. Adjust only as required for "good gray scale and warm highlights".

1. LOW LIGHT areas – In Serviceman Mode for making electronic adjustments, select CUT R, CUT G, CUT B and adjust the picture for gray.
2. HIGH LIGHT areas – In Serviceman Mode for making electronic adjustments, select Drive R DR, B DR and adjust the picture for warm whites.

Complete Adjustment

Preparation:

1. Turn the Receiver "ON" and allow 30 minutes warm up at WHITE PATTERN.
2. Apply a white balance pattern.
3. Set Picture controls to Normalized.
4. Turn the SCREEN control (part of FBT T551) fully counterclockwise.

5. Preset the following Serviceman DACs for best results:
 - CUT R 0 00
 - CUT G 2 80
 - CUT B 0 00
 - R DR 40
 - B DR 40

Procedure:

1. Connect the oscilloscope to TP35 (CRT-Board).
2. In Serviceman Mode for making electronic adjustment, select "BRIGHT" DAC.
3. Press RECALL button on the Remote Control to collapse the raster. (Service SW).
4. Observe oscilloscope waveform and adjust serviceman mode "BRIGHT" DAC until $2.3V \pm 0.05V$ above DC ground is measured (See Fig. 30)

5. Press RECALL button on the Remote to restore the raster.
6. Connect scope to GRN Cathode (KG) on CRT-Board
7. In Serviceman mode for making electronic adjustments, select **CUT G** DAC.
8. Press RECALL button on the Remote to collapse the Raster (Service SW).
9. View scope trace at Horizontal rate and adjust Serviceman Mode "CUT G" DAC for the scanning period to be $170 \pm 2V$ above DC ground (See Fig. 31.)

10. Remove the probe of the oscilloscope.
11. Turn SCREEN VR (Part of FBT) slowly clockwise until a faint green horizontal line appears.
12. Using the other two colors Serviceman Mode DAC CUT R and CUT B change their setting to produce a white horizontal line.
13. Press RECALL button on the Remote Control to restore full raster.
14. Confirm a good gray scale by viewing B/W color bar Pattern.
15. In serviceman Mode select DAC DRIVE adjustment "R DR" and "B DR" and adjust for warm white in white color bar of pattern.
16. If correction is needed perform **Minor Touch-Up Method**.

Service Adjustments (Electronic Controls, cont.)

Deflection Adjustments

Note: Deflection adjustment for RF, 1080i, 480p, dole window mode are provided differently.

H Center Adjustment

Preparation:

1. Apply a crosshatch pattern.

Procedure:

1. If horizontal linearity is poor, in Serviceman Mode, adjust data "H LIN" (See Fig. 32)

Figure 32. H-Adjustment

2. Apply a Monoscope pattern.
3. If the horizontal center is not aligned, in Serviceman Mode adjust "H POS" DATA to adjust the horizontal center of the monoscope pattern to the CRT center.

Vertical Linearity(V-C), V-Size and V-Position Adjustment

Preparation:

1. Apply a Crosshatch pattern

Procedure:

1. Enter Serviceman Mode, Select DAC adjustment "V RAS" and adjust crosshatch pattern to center vertical position to the CRT center.
2. Adjust linearity data "V-C" so that interval of "a" is same as "b" (a=b). (See Fig. 33)

Figure 33. Linearity adjustment

3. If the v-position is not at the CRT center, adjust V position "V RAS" DATA again.

V-S, V-Size Adjustment

Preparation:

1. Apply a Crosshatch pattern.

Procedure:

1. Apply a crosshatch pattern.
2. Enter Serviceman Mode
3. Check a and b sizes, If $b-a < -1.5\text{mm}$ (in top & bottom extending case)
 - a. Increase "V-S" DATA by one step .
 - b. Adjust "VEAMP" so that V-SIZE is regular size again.

Note: Repeat "a" and "b" until $|b-a| \pm 1.5\text{mm}$

4. Check a and b sizes, If $b-a > -1.5\text{mm}$ (in top & bottom shortening case)
 - a. Decrease "V-S" by one step.
 - b. Adjust "VEAMP" so that V-Size is regular size again.

Note: Repeat "a" and "b" until $|b-a| \pm 1.5\text{mm}$

5. Confirm to make outermost circle of monoscope pattern a correct circle.

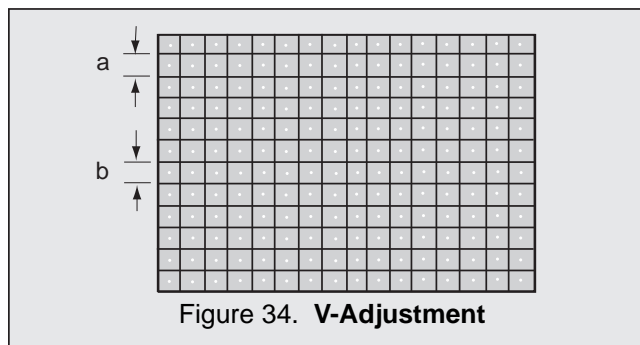

Figure 34. V-Adjustment

Trapezoid, Parallelogram and E-W PCC Adjustment

Trapezoid Adjustment

Preparation:

1. Apply a Crosshatch pattern
2. Normalize the Picture Icon Video adjustments.

Procedure:

1. Enter Serviceman Mode, select "TRAP" and Adjust DATA so that lines at right and left are vertical like a solid line (See Fig. 35)

Figure 35. Trapezoid Adjustment

Parallelogram Adjustment

Preparation:

1. Apply a Crosshatch pattern
2. Normalize the Picture Icon Video adjustments.

Procedure:

1. Enter Serviceman Mode, select "PARA" and adjust so that the lines at right and left are vertical like solid line. (See Fig. 36)

Figure 36. Parallelogram Adjustment

E-W PCC Balance Adjustment

Preparation:

1. Apply a Crosshatch pattern
2. Normalize the Picture Icon Video adjustments.

Procedure:

1. Enter Serviceman Mode, select "SIDE" and adjust so that lines at right and left are vertical like solid line. (See Fig. 37)

Figure 37. SIDE Adjustment

E-W PCC Adjustment

Preparation:

1. Apply a Crosshatch pattern
2. Normalize the Picture Icon Video adjustments.

Procedure:

1. Confirm that trapezoid adjustment is done.
2. Adjust "PCC" DATA so that the 1st line and 3rd line make a good balance (See Fig. 38).

Figure 38. PCC Adjustment

Note: If side and lower side is imbalanced, adjust "PCCHG" and "PCCLG" so that "PCC" make good balance.

Corner PCC Adjustment

Preparation:

1. Apply a Crosshatch pattern
2. Normalize the Picture Icon Video adjustments.

Procedure:

1. To adjust upper and lower linearity.
2. Adjust "TOPG" to straighten upper lines (See Fig. 39)

Figure 39. Top Adjustment

3. Adjust "BTMG" to straighten lower lines (See Fig. 40)

Figure 40. Bottom Adjustment

Note: If TOP-BOTTOM bending point is not so good, adjust "TOPSL" and "BTMSL" of slice level.

H-Size Adjustment

Preparation:

1. Apply a Monoscope pattern

Procedure:

1. Adjust "H WID" DATA so that width "A" and "B" becomes 5.00 ± 0.40 (when using factory pattern) (See Fig. 41).

Figure 41. H-Size Adjustment

Note: When using a different pattern, correlate with factory pattern.

Service Adjustments (Electronic Controls, cont.)

MTS Circuit Adjustments

The MTS Circuit Adjustments require two steps:

1. Input Level Adjustment.
2. Stereo Separation Adjustment.

Input Level Adjustment

Serviceman DAC Adjustment (MTSIN)

Preparation:

1. Connect an RMS meter with filter jig as shown in Fig. 42.

2. Connect an RF signal generator to the RF antenna input.

Procedure:

1. Apply the following signal from the RF signal generator:
Video: 100 IRE flat field, 30% modulation.
Audio: 300Hz, 100% modulation, monaural (70 ±5dB, 75Ω OPEN, P/S 10dB). Make sure that the 75μs pre-emphasis is OFF.
2. Adjust the **MTS Input** Level Adjustment (**MTSIN**) data until the RMS voltage measured is **490 ± 20mVrms**.

Stereo Separation Adjustment (SEPAH)

Preparation:

1. Connect an RF signal generator to the RF antenna input.
2. Connect a scope to TPA19.

Procedure:

1. Select Stereo Mode in Audio menu
2. Apply the following signal from the RF signal generator:
Video: 100 IRE flat field, 30% modulation.
Audio: 300Hz, 30% modulation, stereo (left only) (70±5dB, 75Ω OPEN, P/S 10dB).

Note: After setting 30% modulation with P.L. SW and N.R. SW OFF, turn P.L. SW and N.R. SW ON.

3. In Serviceman Mode, Adjust the MTS Low-Level Separation Adjustment (SEPAL) data until the amplitude displayed on the scope is minimum.
4. Apply the following signal from the RF signal generator:
Video: 100 IRE flat field, 30% modulation.
Audio: 3KHz, 30% modulation, stereo (left only) (70 ±5dB, 75Ω OPEN, P/S 10dB).

Note: After setting 30% modulation with P.L. SW and N.R. SW OFF, turn P.L. SW and N.R. SW ON.

5. Adjust the MTS High-level Separation Adjustment (SEPAH) until the amplitude displayed on the scope is minimum.
6. Repeat above steps 2 through 4 until the amplitude is at minimum for both signals.

Service Adjustments (Electronic Controls, cont.)

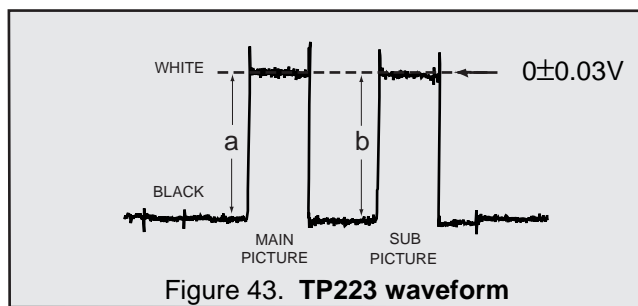

Sub Picture YUV output adjustment

Preparation:

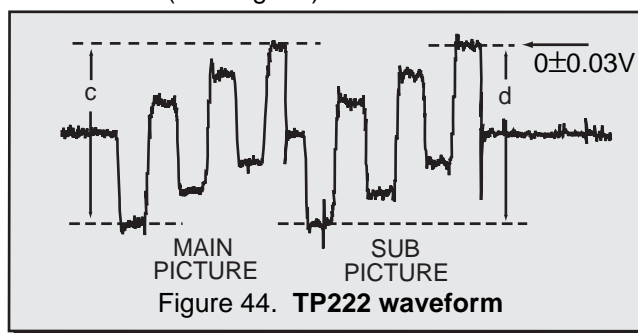

1. Apply a studio color bar pattern.
2. Connect the oscilloscope to TP223(Y).

Procedure:

1. Push "SPLIT/SIZE" key on the remote control.
2. In Serviceman Mode adjust "Y DRV" data so that the amplitude "b" is same level as "a", within $0 \pm 0.03V$. (See Fig. 43).

3. Connect the oscilloscope to TP222(PB).
4. In Serviceman Mode, adjust "UVDRV" data so that the amplitude "d" is same level as "c", within $0 \pm 0.03V$. (See Fig. 44)

Clock Adjustment (CLOCK)

Preparation:

Connect the frequency counter from TPA11 (IC001 Pin 50) to cold ground (↗).

Note: Frequency Counter probe capacitance should be 8pF or less.

Procedure:

1. Turn the Receiver "OFF" with the AC power applied.
2. Measure TPA11 (IC001 pin 50) for the frequency of the waveform and record the reading.

Note: Pin 50 measurement must have at least four digits of resolution following the decimal point. Example: 000.0000

3. Turn the Receiver back "ON".
4. Place the Receiver into Serviceman Mode for making electronic adjustment, select the Clock Adjustment DAC (CLOCK).
5. Calculate and set "CLOCK" based on the following formula:

$$CLOCK = 128 + (0.450) \times 10^6 \frac{\{(732.4220) - pin50[Hz]\}}{(732.4220)}$$

Note: Pin 50 measurement will not change regardless of the value stored in CLOCK.

Service Adjustments (Mechanical Controls)

Width Correction Adjustment

Note: Perform this adjustment only when FBT is changed.

Preparation:

Connect the DVM (Digital Voltage Meter) (+) lead to connector Q10 PIN-10 or TPQ27; and (-) lead to connector Q10 PIN-3.

Procedure:

1. Apply a Black pattern.

Adjust R524 so that the voltage on Connector Q10 Pin-10 or TPQ27 is $1.8 \pm 0.1V$ on D-Board.

Focus (part of T551)

Preparation:

Connect a Signal generator and select a dot pattern.

Procedure:

1. Adjust the FOCUS control to obtain the sharpest and clearest dot pattern.
 - a. Adjust for best center.
 - b. Adjust for best area between the center and top right corner.

Video-Chroma Signal Path Block Diagram

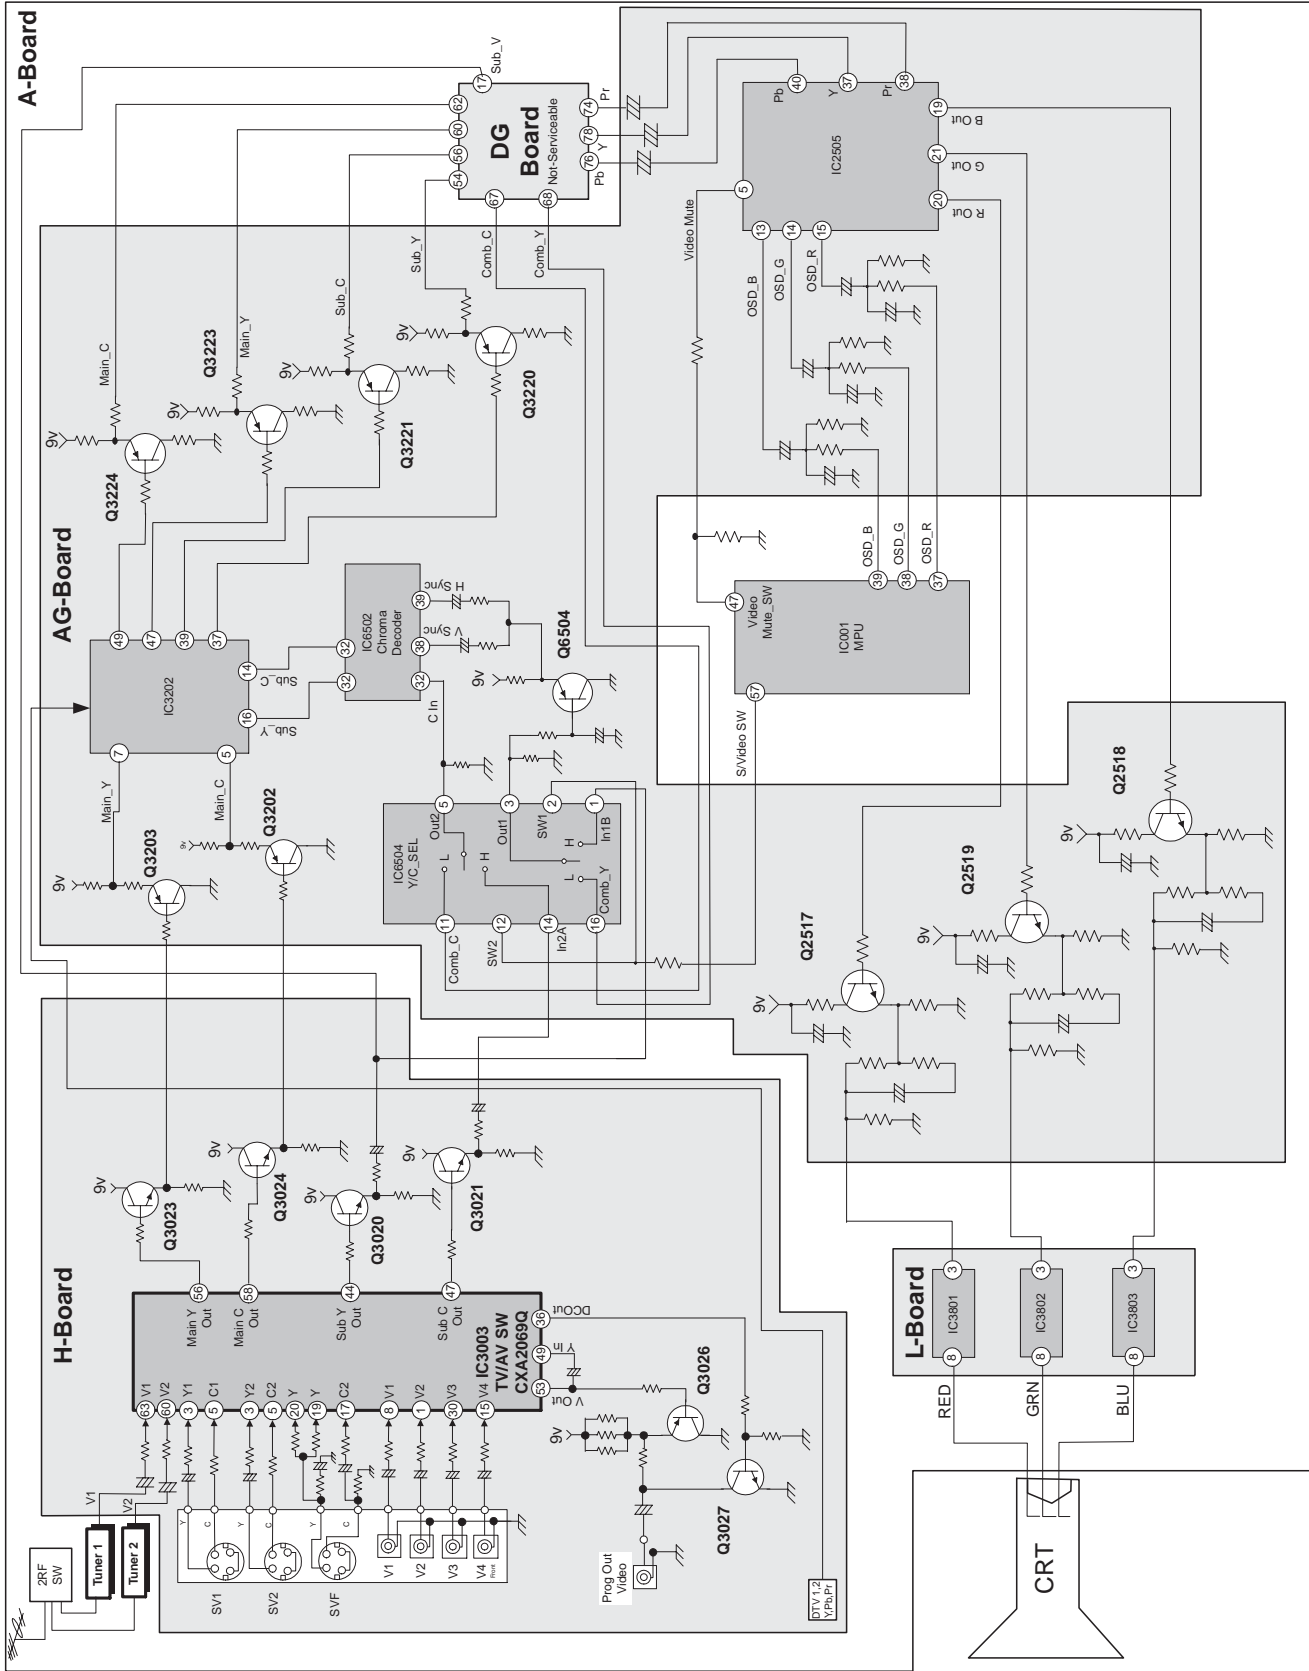

Figure 46. Video-Chroma Signal Path Block Diagram.

NOTES:

1. RESISTOR

All resistors are carbon 1/4W resistor, unless otherwise noted by the following marks.
Unit of resistance is ohm (Ω), (K=1,000, M=1,000,000)

<input type="radio"/>	Non Flammable	<input type="triangle"/>	Solid
<input checked="" type="checkbox"/>	Metal Oxide	<input type="circle"/>	Metal (Precision and high stability)
<input type="checkbox"/>	Wire Wound	<input type="checkbox"/>	Thermistor
<input checked="" type="checkbox"/>	Fusible	<input type="checkbox"/>	Positive coefficient Thermistor
<input checked="" type="checkbox"/>	Flame Proof Rectangular		

2. CAPACITOR

All capacitors are ceramic 50V capacitor, unless otherwise noted by the following marks.
Unit of capacitance is μF , unless otherwise noted.

<input checked="" type="checkbox"/>	Electrolytic	<input checked="" type="checkbox"/>	Metalized Polyester
<input type="circle"/>	Tantalum	<input type="circle"/>	Polypropylene
NP	Bipolar	<input type="triangle"/>	Mica
<input type="circle"/>	Polystyrene	<input type="circle"/>	Ceramic
<input checked="" type="checkbox"/>	Temperature Compensation	<input type="circle"/>	Ceramic (SL)
<input type="circle"/>	Polyester		

3. COIL

Unit of inductance is μH , unless otherwise noted.

4. VOLTAGE MEASUREMENT

Voltage is measured by a digital meter receiving normal signal.

Note: *These schematic diagrams are the latest at the time of printing and are subject to change without notice.*

SERVICE NOTES:

This model has section that does not share a common ground with the power supply section. The different sections are referred to as HOT section and COLD section in the precautions below.

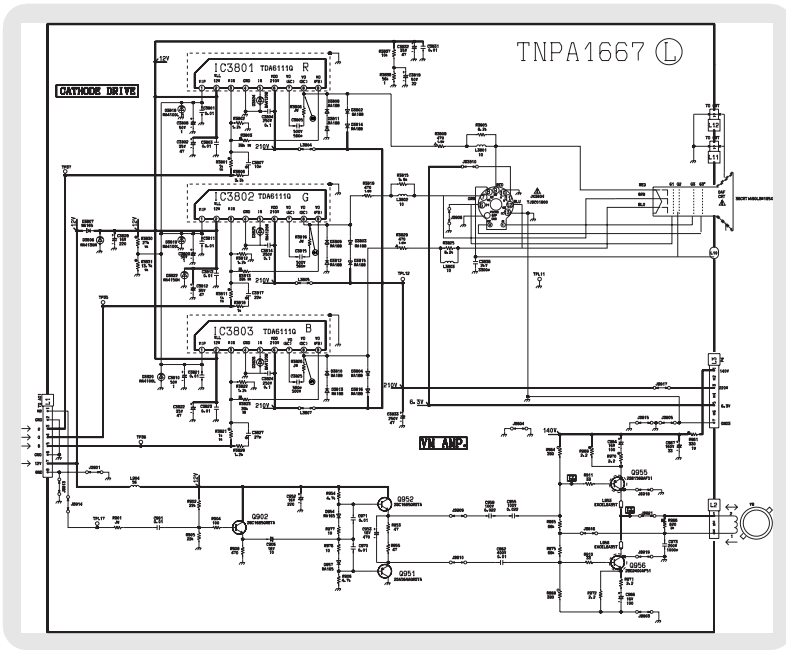

1. Do not touch the HOT section and the COLD section at the same time. You may receive an electric shock.
2. Do not short the HOT section to the COLD section. This could blow the fuse or damage parts.
3. Never measure the HOT section and the COLD section at the same time when using tools such as oscilloscopes or multimeters.
4. Always unplug the unit before beginning any operation such as removing the chassis.
